

WORKSHEET A.4.M2

Multimedia - Sound

What we will learn today:

- Import into Audacity an audio file stored on the computer
- Select, copy, paste and delete a section of audio
- Export audio as an MP3 file

Consolidation Activities

1. Open Audacity. From the File menu, select Open and open the file music1.wav. The screen should look like the one below:

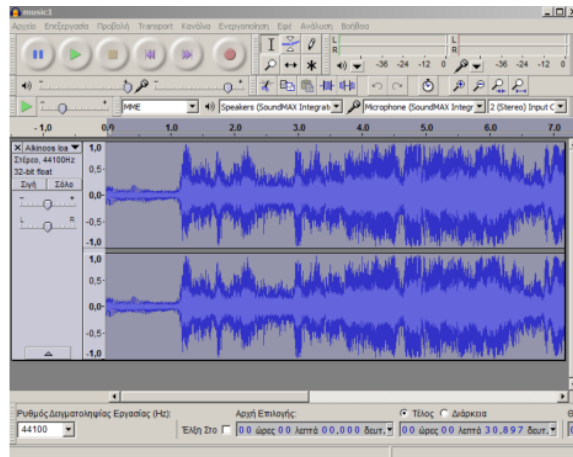

Figure 1: Audacity window

2. At the end of the song, the phrase "όνειρο ήτανε" is heard. Use the Selection Tool to select it. Make sure playback is stopped.
3. Copy your selection (Ctrl+C) and paste it at the end (Ctrl+V), so that the phrase is heard twice.
4. Create a new Audacity file (File → New or Ctrl+N). From the File menu select Open and open music2.wav.
5. The Selection Tool used in question 2 is useful, but it is not precise. To select a specific section by time, use the Selection Bar at the bottom of the Audacity window. If it is not visible, enable it through View → Toolbars → Selection Bar.

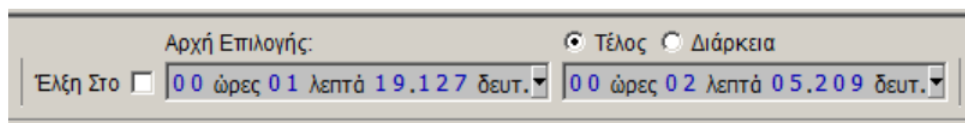

Figure 2: Selection Bar

Using the Selection Bar, delete the first 8.8 seconds of the song.

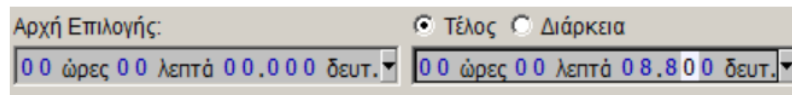

Figure 3: Selecting 8.8 seconds

Repeat the process and delete the section from the 27th second to 37.3 seconds (the end of the song).

6. Select the remaining section (Ctrl+A) and copy it. Go to the original Audacity file (the one containing music1) and paste it at the end of the song.

7. Save your file as example1.aup. This is an Audacity project, so the audio you created cannot be played in another program, such as a media player.

8. You can, however, convert it to MP3: File → Export → choose MP3 as the file type. Use example1 as the filename.

Assessment Activities

9. The example2 folder contains two song excerpts named song1 and song2. Create an MP3 file named example2.mp3 containing the section from the 37th to the 56th second of song1, followed by the first 16 seconds of song2.

+Additional Activities

10. Using excerpts from songs in the songs folder, create a new MP3 file named example3.mp3.
